Mieloo & Alexander Business Integrators

Mieloo & Alexander Business Integrators is a consulting firm specialising in technology enabled business improvement. We successfully design, plan and implement solutions and transform your organisation to achieve sustainable competitive advantage.

We have years of experience, in-depth knowledge of your business and technology and a true hands-on, get it done mentality that has resulted in strong and lasting client relationships.

The professionals working out of our Rotterdam office on projects across Europe deliver outstanding client service, measurable results and satisfied customers.

Business Integration requires technical integration

With our clients increasingly integrating their businesses, technology-driven or related change programs depend as much on successful technical integration as they do on business integrators.

In our view, three factors raise the stakes for these technical experts:

- The tremendous dependency of our multinational clients on their centralised, complex and highly integrated technological backbones.
- Rapid product development of the soft and hardware components of these technology platforms.
- The limited success of packaged integration solutions, placing an increasing need on robust standardised or bespoke middleware solutions.

Technical Integrators

Because Mieloo & Alexander recognises technical integration complexity as one of the highest risks to any change program, we have built a best-in-class technology consulting group that generally operates as part of our multi-disciplinary project teams. However, as the technical expertise of the team is highly sought after, they also take on stand-alone assignments.

Our technical application and infrastructure integration consultants are singled out for their commitment, drive and 24/7 mentality. They combine broad and deep product knowledge with a thorough understanding of business and well-developed people management skills.

We excel at application integration through middleware or bespoke solutions where no standard product will solve the problem, and at technical architecture design, delivery and deployment. Over the years we have gained extensive experience with procurement management and outsourcing/offshoring contract management and implementation.

Adding Value to Your Project

The technology consulting group works in close co-operation with our project and change managers, as well as with the business and IT consultants. This enables Mieloo & Alexander to manage all risks of design and delivery of complex, integrated business and technical solutions.

We will assume full control of the systems infrastructure changes resulting from a project. And we quickly adopt emerging technologies to provide our customers with implementation services related to them.

Moving You into the RFID Era

We believe that RFID technology will be widely applied in the supply chain and retail over the next few years. This will lead to unprecedented transaction data volumes and integration complexity as these data need to be filtered, interpreted, routed through corporate networks and stored and passed onto ERP backbone systems.

Mieloo & Alexander's technology consulting group offers a comprehensive RFID service portfolio, fully up to speed with the latest technological developments and standards used by leading technology vendors.

Long-lasting Client Relationships

Mieloo & Alexander works for a variety of multinational clients on projects across Europe. In recognition of our ability to successfully manage our client's technology changes, we have built long-lasting relationships with companies such as TQ3, Nuon and Akzo Nobel Nobilas.
